Pyratz Corp. unveils Pyratz2036, its ten-year investment thesis for the Intelligence Age

AI may be the biggest revolution humanity has ever lived. Pyratz2036 sets out how to build, invest and retain agency in the economy it creates - rather than simply endure the change.

PARIS, OCTOBER 6TH 2026

PYRATZ CORP. (Euronext Access Paris: MLPTZ; ISIN: FR0013371507) introduces Pyratz2036, its ten-year investment thesis for the economy emerging as artificial intelligence makes intelligence and expertise cheaper and more widely available. The central question is not only what AI will be able to do, but who will own the assets and institutions through which its value reaches the world - and whether people will retain the power to act within it.

The thesis argues that access to powerful technology is not the same as ownership of the value it creates. Europe can develop talent and breakthrough companies yet still lose the capital, infrastructure and decision-making rights that shape their future. Pyratz2036 sets out where Pyratz sees investable value, how it intends to participate as an investor-builder, and what evidence should determine whether it continues to own an asset.

Investing beyond the AI model

Pyratz2036 identifies three connected layers of the emerging economy:

01 Abundance engines AI, robotics, autonomous laboratories and machine-enabled production.	02 Scarce complements Energy, compute, physical infrastructure, proprietary data, land, distribution and trusted networks that intelligence cannot instantly reproduce.	03 Regulated gateways Healthcare, finance, insurance, defence, identity, energy and mobility - fields where technical capability must also earn permission, trust and access to the real economy.
---	--	--

These are areas to investigate, not a commitment to invest equally in every sector. Pyratz will test each opportunity for a durable source of value, a credible financial return, evidence at defined milestones and its effect on human choice. Thematic relevance alone is not an investment case; nor is regulation alone a moat worth owning.

The thesis in action

Pyratz's investment in Moonshot AI, developer of the Kimi family of AI models, announced on 3 September 2026, illustrates its participation in the abundance-engine layer. Pyratz also plans to announce a separate deal in space and robotics soon. The company will disclose the counterparty, scope and terms in a dedicated announcement; this release does not present that deal as completed.

Ownership with responsibility

Pyratz combines selective investment, company-building and operating support with the ambition to hold exceptional assets for as long as the evidence supports ownership. Its European character does not limit the opportunity set to Europe. The test is whether global participation also helps build and retain durable European capabilities and meaningful ownership.

"We believe AI is the biggest revolution humanity has ever lived. Pyratz2036 is our way of taking advantage of it instead of enduring it: backing the technologies that create abundance, owning the systems that make it real, and keeping people able to shape their own future."

Bilal El Alamy - Founder, Chairman and Chief Executive Officer of Pyratz Corp.

The thesis also confronts a wider risk: if machines perform a growing share of valuable work, cheaper goods and services alone will not guarantee bargaining power, purpose or freedom. Economic participation matters, but an investment stake is not the same as control, and ownership by itself cannot replace privacy, the ability to leave or accountable institutions. Pyratz2036 proposes an agency test for investments alongside financial discipline; proposed governance mechanisms remain subject to corporate, legal and regulatory decisions.

A horizon for accountability - not prophecy

2036 is the horizon by which Pyratz expects to be judged for its choices, not a prediction that every frontier technology will mature within ten years. The thesis calls for assessing investment performance alongside enduring ownership, European capability and the effects of portfolio companies on human agency. It is a framework for making and revising decisions under uncertainty, not a forecast of technological milestones or a promise of investment returns.
